

Syntax and semantics of dependent types.

Cours MPRI catégories et lambda-calcul.

15 février 2010

Outline

Dependent types

- Some motivations
- The type system
- Dependent function
- Natural numbers
- Dependent sum
- Identity types
- Universes

Category-theoretic semantics

- Context morphisms
- Categories with families
- Interpretation

Antoine Delignat-Lavaud
École Normale Supérieure de Cachan

1 Dependent types

- Some motivations
- The type system
- Dependent function
- Natural numbers
- Dependent sum
- Identity types
- Universes

2 Category-theoretic semantics

- Context morphisms
- Categories with families
- Interpretation

Outline

Dependent types

- Some motivations
- The type system
- Dependent function
- Natural numbers
- Dependent sum
- Identity types
- Universes

Category-theoretic semantics

- Context morphisms
- Categories with families
- Interpretation

Dependent types

- 1 Types that depend on or vary with **values**.
- 2 Example : $Vec_{\tau}(M)$, type of vectors of length M
- 3 M is a value in the calculus
- 4 The dependency is written $\Pi x : N. Vec_{\tau}(x)$
- 5 Benefits : types are more accurate (e.g. $N \rightarrow List(N)$)
- 6 More expressive static verification :
 $H : \Pi x : N. Vec_{\tau}(Suc(x)) \rightarrow \tau$
- 7 Programs on length dependent vectors must satisfy length constraints to type.
- 8 Another example : ordered vectors

Outline

Dependent types

Some motivations

- The type system
- Dependent function
- Natural numbers
- Dependent sum
- Identity types
- Universes

Category-theoretic semantics

- Context morphisms
- Categories with families
- Interpretation

- Universes

Category-theoretic semantics

- Context morphisms
- Categories with families
- Interpretation

Type-checking

- 1 How to test equality of dependent types ?
- 2 **Computation** may be required $Vec_{\tau}(1)$, $Vec_{\tau}(0 + 0 + 1)$
- 3 Arbitrary dependance : typing is undecidable.
- 4 Built-in type equality

$\vdash \Gamma \text{ ctx}$	Γ is a valid context
$\Gamma \vdash \sigma \text{ type}$	σ is a valid type in context Γ
$\Gamma \vdash M : \sigma$	M is a term of type σ in context Γ
$\vdash \Gamma = \Delta \text{ ctx}$	Γ, Δ are definitionally equal contexts
$\Gamma \vdash \sigma = \tau \text{ type}$	σ, τ are definitionally equal types in context Γ
$\Gamma \vdash M = N : \sigma$	M, N are equal terms of type σ in context Γ

Categories with families

Interpretation

Dependent product

- 1 A dependent function $\Pi x : \sigma. \tau$ is interpreted as a cartesian product $\prod_{i \in I} B_i$.
- 2 Formation and equality rules as expected
- 3 Dependent functions can be eliminated with the dependent application

$$\frac{\Gamma \vdash M : \Pi x : \sigma. \tau \quad \Gamma \vdash N : \sigma}{\Gamma \vdash \text{App}_{[x:\sigma]\tau}(M, N) : \tau[x \leftarrow N]}$$

Interpretation

Natural numbers

- 1 We build numbers from 0 and $\text{Succ}(M)$.
- 2 We use an eliminator $R^{\mathbb{N}}$ to substitute integers in types.
- 3 The eliminator tests both 0 and $\text{Succ}(n)$

$$\frac{\begin{array}{c} \Gamma \vdash M : \mathbb{N} \\ \Gamma, n : \mathbb{N} \vdash \sigma \text{ type} \\ \Gamma \vdash H_z : \sigma[n \leftarrow 0] \\ \Gamma, n : \mathbb{N}, x : \sigma \vdash H_s : \sigma[n \leftarrow \text{Succ}(n)] \end{array}}{\Gamma \vdash R_{[n:\mathbb{N}]\sigma}^{\mathbb{N}}(H_z, [n : \mathbb{N}, x : \sigma]H_s, M) : \sigma[n \leftarrow M]}$$

Identity types

- 1 Address the problem of dependent type equality
- 2 For all the previous constructors, we define identity rules, such as :

$$\frac{\Gamma \vdash \lambda x : \sigma. M^\tau : \prod x : \sigma. \tau \quad \Gamma \vdash N : \sigma}{\Gamma \vdash \mathit{App}_{[x:\sigma]\tau}(\lambda x : \sigma. M^\tau, N) = M[x \leftarrow N] : \tau[x \leftarrow N]}$$

- 3 Equality is a judgement outside the type theory
- 4 We introduce an identity constructor to have embedded equality.

$$\frac{\Gamma \vdash M : \sigma \quad \Gamma \vdash N : \sigma}{\Gamma \vdash \mathit{Id}_\sigma(M, N) \text{ type}} \quad \frac{\Gamma \vdash M : \sigma}{\Gamma \vdash \mathit{Refl}_\sigma(M) : \mathit{Id}_\sigma(M, M)}$$

Identity types

- 1 Address the problem of dependent type equality
- 2 For all the previous constructors, we define identity rules, such as :

$$\frac{\Gamma \vdash \lambda x : \sigma. M^\tau : \Pi x : \sigma. \tau \quad \Gamma \vdash N : \sigma}{\Gamma \vdash \mathit{App}_{[x:\sigma]\tau}(\lambda x : \sigma. M^\tau, N) = M[x \leftarrow N] : \tau[x \leftarrow N]}$$

- 3 Equality is a judgement outside the type theory
- 4 We introduce an identity constructor to have embedded equality.

$$\frac{\Gamma \vdash M : \sigma \quad \Gamma \vdash N : \sigma}{\Gamma \vdash \mathit{Id}_\sigma(M, N) \text{ type}} \quad \frac{\Gamma \vdash M : \sigma}{\Gamma \vdash \mathit{Refl}_\sigma(M) : \mathit{Id}_\sigma(M, M)}$$

Context morphisms

If Γ and $\Delta = x : \sigma_1 \dots x_n : \sigma_n$ are valid contexts and $f = (M_1 \dots M_n)$ is a sequence of syntactic terms, we say that f is a context morphism from Γ to Δ , denoted $\Gamma \vdash f \Rightarrow \Delta$, if :

$$\Gamma \vdash M_1 : \sigma_1 \quad \dots \quad \Gamma \vdash M_n : \sigma_n [x_i \leftarrow M_i, i \leq n]$$

Context-morphism substitution, up to renaming of variables, is denoted $\tau[\Delta \leftarrow f]$.

CwF

- 1 \mathcal{C} category of semantic contexts and morphisms
- 2 For $\Gamma \in \mathcal{C}$, a collection $Ty_{\mathcal{C}}(\Gamma)$ of semantic types
- 3 For $\Gamma \in \mathcal{C}$ and $\sigma \in Ty_{\mathcal{C}}(\Gamma)$, a collection $Tm_{\mathcal{C}}(\Gamma, \sigma)$ of semantic terms

Example

Set has a CwF : sets are contexts, maps are morphisms, elements of $Ty_{Set}(\Gamma)$ are families of sets indexed over Γ , elements of $Tm_{Set}(\Gamma, \sigma)$, with $(\sigma_{\gamma})_{\gamma \in \Gamma} \in Ty_{Set}(\Gamma)$, is an assignment of an element $M(\gamma)$ of σ_{γ} for all $\gamma \in \Gamma$.

Category of families of sets

We define the category of families of sets Fam with object pairs $B = (B^0, B^1)$ where B^0 is a set and $B^1 = (B^1_b)_{b \in B^0}$ is a family of sets indexed over B^0 . A map is a pair (f^0, f^1) where $f^0 : B^0 \rightarrow C^0$ is a function and $f^1 = (f^1_b)_{b \in B^0}$.

Types and terms functor

$$\mathcal{F}(\Gamma) = (Ty(\Gamma), (Tm(\Gamma, \sigma))_{\sigma \in Ty(\Gamma)}) : \mathcal{C}^{op} \rightarrow Fam$$

Interpretation

We define the interpretation by induction on the length of the syntactic contexts, types and terms.

- 1 $[]$ maps pre-contexts to objects of \mathcal{C} .
- 2 Pairs $\Gamma; \sigma$ to families in $\mathcal{T}y([\Gamma])$.
- 3 Pairs $\Gamma; M$ to elements of $\mathcal{T}m(\sigma)$ for some $\sigma \in \mathcal{T}y([\Gamma])$

$$[\Gamma; x : \sigma] = [\Gamma].[\Gamma; \sigma] \text{ if } x \notin \Gamma$$

$$[\Gamma; \Pi x : \sigma. \tau] = \Pi([\Gamma; \sigma], [\Gamma, x : \sigma; \tau])$$

$$[\Gamma; x : \sigma, \Delta, y : \tau; x] = [\Gamma, x : \sigma, \Delta; x] \{ \rho([\Gamma, x : \sigma, \Delta; \tau]) \}$$

$$[\Gamma; App_{[x:\sigma]\tau}(M, N)] = App_{[\Gamma;\sigma],[\Gamma,x:\sigma;\tau]} \circ \langle [\Gamma; M], [\Gamma; N] \rangle_{[\Gamma;\Pi x:\sigma.\tau]}$$

$$[\Gamma; \lambda x : \sigma. M^T] = \lambda_{[\Gamma;\sigma],[\Gamma,x:\sigma;\tau]}([\Gamma, x : \sigma; M])$$
